🔧 **What you're being asked to build**

You're creating a **multi-page interactive website** that includes:

1. Core pages (minimum expectation)

Think in terms of a small real-world site:

- Home page
- About / Services page
- Contact page (with **form validation**)
- At least one additional interactive page

---

2. Required technical features

You **must demonstrate**:

🧱 **HTML (Structure)**

- Semantic layout (header, nav, section, footer)
- Accessible structure (labels, alt text, ARIA where needed)

🎨 **CSS (Design)**

- Responsive layout (mobile-friendly)
- Good UX/UI (spacing, readability, consistency)

⚙️ **JavaScript (Interactivity)**

You need **multiple dynamic features**, such as:

- Form validation (required)
- Animations or transitions
- Image effects (hover, sliders, galleries)
- Date/time display
- Calculator or dynamic tool
- LocalStorage or cookies

📚 Optional frameworks (recommended)

- jQuery (for DOM manipulation / effects)
- You *can* use others, but keep it simple unless confident

🧠 What markers are really looking for

Not just code — **your thinking matters more than the code itself**.

They want to see:

- Why you designed it that way (UX reasoning)
- How you validated inputs
- Testing and reflection
- Accessibility considerations

👉 Important line from brief:

"Poorly described code, regardless of its quality, is unlikely to receive credit."

So explanation = marks.

🧩 Suggested project ideas (pick one strong concept)

Choose something realistic and interactive:

- Event booking website
- Fitness tracker / gym site
- Restaurant ordering system
- Travel booking site
- Student marketplace
- Portfolio generator

👉 Tip: pick something that naturally needs forms + interaction.

🧪 Form validation (very important)

Your form should validate things like:

- Name (not empty)
- Email (correct format)
- Phone number (pattern)
- Password strength (if included)

Include:

- Real-time validation (on input)
- Error messages
- Prevent submission if invalid

💡 Good feature combinations (high marks)

Aim for **5–7 interactive elements**, for example:

- Animated navigation menu
- Image carousel / gallery
- Dark/light mode toggle (LocalStorage)
- Booking form with validation
- Price calculator
- Countdown timer or live clock

📄 Report requirements (this is big)

Each person writes **~1800 words**, including:

Must include:

- Project overview
- UX design decisions
- Wireframes / structure explanation

- Technical implementation (HTML/CSS/JS)
- Validation methods
- Testing & evaluation
- Reflection (what worked / didn't)

Also:

- Clearly state **who did what**

📦 **Submission checklist**

You must submit:

✅ ZIP file with:

- All HTML, CSS, JS files
- Assets (images, etc.)

✅ PDF report
✅ Peer review form

🚨 If code is missing → **automatic zero**

⚠️ **Common mistakes to avoid**

- Only one page (you need multiple)
- Weak or no JavaScript
- No real validation (just HTML5 required fields)
- No explanation in report
- Poor teamwork documentation
- Not using LocalStorage / dynamic features

👫 **Group strategy (important)**

Split work like this:

- **Person 1:** HTML + structure + accessibility
- **Person 2:** CSS + UX design
- **Person 3:** JavaScript + interactivity

But:

- Everyone contributes to report
- Use Git (or similar) to track contributions

🏆 **What gets high marks**

- Clean, modern UI
- Strong UX reasoning
- Advanced JS features (not just basics)
- Proper validation logic
- Clear documentation
- Evidence of teamwork
